Acids and Bases - Definition, Examples, Properties, Uses ...

In chemistry, acids and bases have been defined differently by three sets of theories. One is the Arrhenius definition, which revolves around the idea that acids are substances that ionize (break off) in an aqueous solution to produce hydrogen (H^+) ions while bases produce hydroxide (OH^-) ions in solution.

Bases can be thought of as the chemical opposite of acids. A reaction between an acid and base is called a neutralization reaction. The strength of an acid refers to its ability or tendency to lose a proton; a strong acid is one that completely dissociates in water.

Acidity is the quality that gives liquids such as vinegar and lemon juice their lip-puckering taste. In fact, the term acid comes from the Latin term *acere*, which means "sour". The chemical opposites of acids are bases, compounds that often feel soapy or slippery and lend bitterness to foods such as walnuts and broccoli.

Acids and Bases I | Chemistry | Visionlearning

Acids with a low pH of around 1 are very reactive and can be dangerous. The same is true for bases of a pH near 13. Chemists use strong acids and bases to get chemical reactions in the lab. Although they can be dangerous,

Kids science: Acids and Bases - Ducksters

While there are many slightly different definitions of acids and bases, in this lesson we will introduce the fundamentals of acid/base chemistry. In the seventeenth century, the Irish writer and amateur chemist Robert Boyle first labeled substances as either acids or bases (he called bases alkalies), according to the following characteristics:

Acids and Bases Chemistry - Basic Introduction - YouTube

The first definition of Acids and Bases was given by Arrhenius and according to his theory, acids dissociate in water to form protons (H^+) and bases dissociate in water to form (OH^-):
The restriction of this theory spread mostly on organic bases since they do react with acids but they are not hydroxide ions.

Acids, bases and the pH scale

Acids are molecules that split apart in water and release hydrogen ions. Think about hydrochloric acid (HCl). When HCl is added to water, it splits into H^+ (hydrogen ions) and Cl^- (chlorine ions).

Acids and Bases - Chemistry for Kids | Mocomi

Throughout history, chemists have created different definitions of acids and bases. Today, many people use the Brønsted-Lowry version. It describes an acid as a molecule that will give away a proton — a type of subatomic particle, sometimes called a hydrogen ion — from one of its hydrogen atoms.

Salt (chemistry) - Wikipedia
Common laboratory acids include hydrochloric acid (HCl), sulfuric acid (H₂SO₄) and nitric acid (HNO₃). Common laboratory bases include potassium hydroxide (KOH), magnesium oxide (MgO), calcium carbonate (CaCO₃) and sodium hydrogen carbonate (NaHCO₃). A strong acid or base completely ionises in solution.
