File system design is governed by two general forces: technology, which provides a set of basic building blocks, and workload, which determines a set of operations that must be carried out efficiently.

This section summarizes technology changes that are underway and describes their impact on file system design.

System design is the phase that bridges the gap between problem domain and the existing system in a manageable way. This phase focuses on the solution domain, i.e. "how to implement?" It is the phase where the SRS

document is converted into a format that can be implemented and decides how the system will operate.
