Multiple Imputation For Nonresponse In

Multiple imputation is a statistical technique designed to take advantage of the flexibility in modern computing to handle missing data. With it, each missing value is replaced by two or more imputed values in order to represent the uncertainty about which value to impute. The ideas for.

Multiple Imputation for Nonresponse in Surveys

About this book Demonstrates how nonresponse in sample surveys and censuses can be handled by replacing each missing value with two or more multiple imputations. Clearly illustrates the advantages of modern computing to such handle surveys, and demonstrates the benefit of this statistical technique for researchers who must analyze them.

Abstract: We outline a framework for multiple imputation of nonignorable item nonresponse when the marginal distributions of some of the variables with missing values are known. In particular, our framework ensures that (i) the completed datasets result in design-based estimates of totals that are plausible, given the margins, and (ii) the completed datasets maintain associations across variables as posited in the imputation models.

There are several ways of dealing with nonresponse problems. For unit nonresponse normally weighting methods are applied. To compensate for item nonresponse a range of missing data methods exist, such as available case method, imputation methods, weighting methods and model-based procedures such as maximum likelihood estimation.

In summary, multiple imputation is an attractive and feasible approach for analyzing data sets with missing values and for assessing and potentially correcting for nonresponse bias. This analysis demonstrates the utility of multiple imputation in a large population-based study of prostate disease.

Multiple Imputation for Nonresponse in Surveys - Sugden ...

Multiple imputation (Rubin, 1987) was first conceived as a tool that statistical agencies could use to handle nonresponse in large data sets that are disseminated to the public. The basic idea is for the statistical agency to simulate values for the missing data repeatedly by sampling from predictive distributions of the missing values.
