Plans for Everything - Pulse Jet Engine Plans

A pulsejet engine is a type of jet engine in which combustion occurs in pulses. A pulsejet engine can be made with few or no moving parts, and is capable of running statically. Pulsejet engines are a lightweight form of jet propulsion, but usually have a poor compression ratio, and hence give a low specific impulse. One notable line of research of pulsejet engines includes the pulse detonation engine, which involves repeated detonations in the engine, and which can potentially give high compress

Pulsejet - Wikipedia

The pulse jet is the only jet engine combustor that shows a net pressure gain between the intake and the exhaust. All the others have to have their highest pressure created at the intake end of the chamber. From that station on, the pressure falls off. Such a decreasing pressure

Theoretical and Experimental Evaluation of Pulse Jet Engine

The origins of the Argus As 014 lie in 1928, when Munich inventor Paul Schmidt began work on a new design of pulse jet engine. Schmidt received a patent on his design in 1931 and received support from the German Air Ministry in 1933. In 1934, along with Professor Georg Madelung, Schmidt proposed a "flying bomb" to be powered by his pulse jet to the Ministry and received a development contract the following year.

Pulsejet engine design has been considered something of a "black art" by many, and it's true that designing an efficient, highly optimized engine still requires a lot of trial-and-error along with a good dose of experience.

A correctly designed engine start very easy at 10% throttle then they can be throttled up to full power. A pulse jet engine will run on anything that will burn, gasoline, methyl alcohol, ethyl alcohol, mixture of 75% gas 25% kerosene, and propane.

Leaving the engine, the two jets exert a pulse of thrust – they push the engine in the opposite direction. As the gas expands and the combustion chamber empties, the pressure inside the engine drops.

Design and development In 1935, Paul Schmidt and Professor Georg Hans Madelung submitted a design to the Luftwaffe for a flying bomb. It was an innovative design that used a jet engine, a pulse-jet engine, while previous work dating back to 1915 by Sperry Gyroscope , relied on propellers.

V-1 flying bomb - Wikipedia

As the simplest form of a jet engine after ramjet and the earliest jet engine concept, pulsejets are very cheap and quite powerful, but very fuel-inefficient and extremely loud. Their specific fuel consumption is about 2 (units of fuel per one unit of thrust in an hour), which is twice of a pure turbojet.

A pulse detonation engine is a type of propulsion system that uses detonation waves to combust the fuel and oxidizer mixture. The engine is pulsed because the mixture must be renewed in the combustion chamber between each detonation wave and the next. Theoretically, a PDE can operate from subsonic up to a hypersonic flight speed of roughly Mach 5. An ideal PDE design can have a thermodynamic efficiency higher than other designs like turbojets and turbofans because a detonation wave rapidly compr

BIG PULSE JET PROJECT - COLINFURZE

Most pulsejet engines use independent intake and exhaust pipes. A physically simpler design combines the intake and exhaust aperture. This is possible due to the oscillating behaviour of a pulse engine. One aperture can act as exhaust pipe during the high-pressure phase of the work cycle and as intake during the aspiration phase.

Pulse-jets are a simple yet powerful engine, capable of producing significant amounts of thrust but also producing large amounts of heat and high noise levels. Because the application and operation of the engines built from these kits is beyond my control I can accept no responsibility for any damage or loss caused by their use or misuse.
