A panel data is a multi-dimensional data of an observation that is measured repeatedly over time. This is a one-liner definition, but a lot to unpack from. This definition implicitly describes three key properties of a panel dataset: property 1: the same

the dependent variable is used as regressor: $y_{it} = \alpha + \beta_1 y_{it-1} + \beta_2 x_{it} + \epsilon_{it}$, The presence of the lagged dependent variable violates strict exogeneity, that is, endogeneity may occur. The fixed effect estimator and the first differences estimator both rely on the assumption of strict exogeneity.
