?.  $12 = (\alpha + 1)r^2[\alpha \sin((\alpha/2)\theta) + \sin(\alpha\theta)]$  The boundary condition stating that the crack surface is stress-free, results in two equations for the unknown constants  $\alpha$  and  $r$ . For a non-trivial solution the equations need to be dependent. This con?nes the values of  $\alpha$  to be a series of discrete numbers.

The stress intensity factor was developed in 1957 by George R Irwin, the man usually considered to be the father of fracture mechanics . The stress intensity factor is abbreviated SIF and represented by the variable,  $\sqrt{K}$ . It is one of the most fundamental and useful parameters in all of fracture mechanics.

On Fracture Mechanics A major objective of engineering design is the determination of the geometry and dimensions of machine or structural elements and the selection of material in such a way that the elements perform their operating function in an efficient, safe and economic manner. For this reason the results of stress analysis are coupled with an appropriate failure criterion.

Fracture mechanics is the field of mechanics concerned with the study of the propagation of cracks in materials. It uses methods of analytical solid mechanics to calculate the driving force on a crack and those of experimental solid mechanics to characterize the material's resistance to fracture.. In modern materials science, fracture mechanics is an important tool used to improve the ...

Fracture mechanics refers to the mechanics of solids containing planes of displacement discontinuities (cracks) with special attention to their growth. Fracture mechanics is a failure theory that: Determines material failure by energy criteria, possibly in conjunction with strength (or yield) criteria. Considers failure to be propagating throughout the structure rather than simultaneous throughout the entire failure zone or surface.
